

PRO TERMINAL · USER GUIDE

SLIMEWIRE

Find it · Buy it · Bank it — all in one fast terminal

A clean, professional Solana memecoin terminal. Scan live pairs, read a coin in seconds, and buy or sell with one tap. Every tool is built right in — Swap, Bundle, Volume, Copy-Trade and Launch. This guide walks a brand-new user through all of it.

slimewire.org/gg

 **1-Tap Buy**

 **Live Chart**

 **Swap**

 **Bundle**

 **Volume**

 **Copy**

 **Launch**

Open **slimewire.org/gg** on phone or desktop. The bar across the top is your map — **Trending, Swap, Bundle, Volume, Copy, Launch, Wallet** and **Portfolio**. Everything below shows you how each one works, in the order a new user should learn them.

What's inside

- | | |
|--|-----------------------------------|
| 1. Get a trading wallet | 6. Bundle |
| 2. Find coins (the tabs) | 7. Volume bot |
| 3. The coin page | 8. Copy / KOL trade |
| 4. Buy & sell (1-tap + presets) | 9. Launch a coin |
| 5. Swap | 10. Wallet & Portfolio |
| | 11. Stay safe |

1 GET A TRADING WALLET

Before you can buy, you need a wallet with SOL in it. Open the **Wallet** tab — you've got two ways in.

Connect & fund (recommended)

- 1 Tap **Connect** and pick **Phantom** or **Solflare**. Approve in your wallet popup.
- 2 SlimeWire offers to spin up a fresh **trading wallet** for you and asks how much **SOL** to move into it.
- 3 You approve that transfer **in your own wallet** — SlimeWire never holds your keys. The new wallet is funded and ready.
- 4 A **backup file + recovery keys** are generated automatically. Save them somewhere safe.

Create an empty wallet

Prefer to fund it later? Tap **Create Wallet** to make a fresh trading wallet with a zero balance, then send SOL to its address whenever you're ready.

Save your backup. Your recovery file is the **only** way back into a trading wallet if you lose your device. No backup = no recovery. Store it offline.

Why a trading wallet? It keeps your main wallet clean — you fund the trading wallet with only what you want to play with, and the terminal buys and sells from it instantly.

2 FIND COINS — THE TABS

The **Trending** screen is your hunting ground. Each tab pulls a different slice of the market, so you can find exactly the kind of coin you're after.

Trending

The hottest pairs right now by real momentum and volume.

New

Brand-new launches, streaming in seconds after they go live.

Surging

Coins jumping hard on the short timeframe — movers with green candles.

Top Volume

Where the real money is flowing — highest 24h trade volume.

Graduating

Pump.fun coins close to bonding (~\$69K cap) — about to hit the open market.

Migrated

Coins that already graduated and moved to a full DEX pool.

Reading a row

Every row shows the coin's **price**, **market cap**, **age**, **volume** and price move at a glance. Where a coin has them, its **social links** (X, Telegram, website) sit right next to the copy-address button — tap to check the project before you ape.

Tip: start in **Trending** or **Surging** to see what's moving, use **Graduating** to catch pump coins right before they bond, and **New** if you want to be earliest. Paste any **contract address (CA)** in search to jump straight to a coin.

3 THE COIN PAGE

Tap any coin to open it. The chart loads instantly, and three tabs hold everything you need to make a call.

Chart

Live price chart — candles update in real time.

Transactions

Every buy and sell as it happens, with size and price.

Positions

Your own holdings in this coin and their live PnL.

The security panel

Open the **••• More** menu for the safety read — it fills fast the moment you tap it:

- **Holders & top-holder %** — is the supply spread out or concentrated?
- **Dev holds** — how much the creator still controls.
- **Smart money & early buyers** — who's in and how early.
- **LP burned, mint & freeze authority** — the classic rug checks.

One screen, one decision. Chart for the trend, Transactions for the pressure, the security panel for the risk — then buy right there without leaving the page.

4 BUY & SELL — ONE TAP

The fastest way to trade. Set your presets once, then every buy is a single tap.

⚡ First time you tap Buy

- 1 Tap **Buy** on any coin row. The first time, a **quick-buy menu** opens.
- 2 Set **your presets**: how much **SOL** to spend, plus an optional **take-profit** and **stop-loss**.
- 3 Save them. From now on, tapping **Buy** fires **instantly** at your preset — no menu, no confirm dialog.

Built for speed. Once your presets are set, the bar amount or a preset chip buys on the first tap. You can change presets any time in the **Wallet** → **Presets** tab.

- 1 Open the coin's **Positions** tab (or the **Portfolio** page) to see the bag with live PnL.
- 2 Pick a **sell %** — **25%** **50%** **100%** or custom — and it sells from that wallet.
- 3 Or rely on the **take-profit / stop-loss** you set at buy time to exit automatically.

5 SWAP

One panel for any trade. Swap lives in its own tab — no jumping around.

- 1 Open **Swap**. Pick from the **popular pairs** or paste a **custom CA**.
- 2 Set your **amount** and **slippage**.
- 3 Tap the **flip** button to switch between **buy** (token on top) and **sell** (token on the bottom) — same panel, no second screen.
- 4 Confirm in your wallet and the swap fires.

Slippage: how much price movement you'll accept on the fill. Fresh or volatile coins need more (try 5–10%). 100 bps = 1%.

6 BUNDLE

Buy or sell the **same coin across several wallets at once** — perfect for spreading a launch buy or exiting together with a planned ladder.

- 1 Paste the **token CA** and pick the **wallets** to include.
- 2 Choose a **preset**, or set **staggered, varied amounts** so the buys aren't all identical.

3 Add a **laddered take-profit / stop-loss** with a **min** and **max** — so it doesn't profit-take too low, and sells in steps instead of one big dump.

4 Fire the bundle. Buys and sells go out fast across every selected wallet.

The **min/max ladder** means your bundle takes some profit early but rides the rest toward your max target — natural, staged exits instead of one all-or-nothing clip.

7 VOLUME BOT

Generate lifelike trading **volume** on a token. You fund it from one wallet and it does the rest — automatically.

1 Set the **token CA** and **fund** it from your wallet — that's the only number you have to pick.

2 It creates **ghost wallets** in the background as needed — unlimited, no setup — and buys and sells from **different wallets** so the flow looks organic.

3 Tune the feel: **min/max buy, speed** (low / med / high) and a **chart shape** (steady, waves, organic, uptrend). Sells vary in size, and a partial sell is finished off later so nothing looks robotic.

4 Optionally **leave a token** in each wallet to bump the holder count. It runs until the funded SOL is spent, then **sweeps everything back** to your wallet.

Real money: the volume bot spends real SOL across many trades and fees add up. Start with a small fund and a short run to see how it behaves.

8 COPY / KOL TRADE

Follow the wallets that know what they're doing. The **Copy** tab lists known **KOLs** with their picture and **ROI**, plus a custom box for any wallet.

1 Browse the **KOL list** — each shows a **pfp, ROI** and recent activity.

2 Tap a KOL to open their **profile**: current positions, social links and their track record.

3 Hit **Copy** to mirror their trades, or paste **any wallet address** to copy a wallet that isn't on the list.

Copy-trading isn't a guarantee — even great wallets take losses. Size your copy trades like any other bet.

9 LAUNCH A COIN

Launch your own coin on **pump.fun** — a full native panel, right here, with everything pump has.

The launch sheet

Name & Symbol

Your coin's name and ticker.

Image & Banner

The coin picture and a banner image — what people see first.

Socials & Description

Website, X, Telegram and your blurb.

Dev Buy

Your own opening buy at launch so you're not buying at zero.

Anti-snipe bundle

Turn on the **Jito anti-snipe bundle** to bundle your **dev buy with the launch** in one atomic block — so snipers can't jump in front of you on the first buy.

Chat & Live (hidden dropdown)

A tidy dropdown — hidden until you want it — holds the **pump chat** link and the **live recording** option, so the main panel stays clean.

1 Fill the sheet, set your **dev buy** and toggle the **anti-snipe bundle**.

2 Tap **Launch** — SlimeWire mints it and hands you the live **CA**.

3 Drop that CA into **Bundle** to spread an opening buy, and you're live.

10 WALLET & PORTFOLIO

Your money, always one tap away — and it loads **instantly**.

Wallet

Balances, connect & fund, create wallets, backup/restore, and your **Presets** tab (set or remove quick-buy and bundle presets).

Portfolio

Every open position with live PnL and one-tap exits.

Rewards

Your referral perks and earned rewards.

Instant by design. Wallet balances and positions paint from cache the moment you open them, then refresh in the background — no spinner, no waiting.

! STAY SAFE

- **Only fund what you can lose.** Memecoins are high-risk — your trading wallet should hold only your play money.
- **Check the security panel** before you ape: holders, dev holds, LP burned, mint & freeze authority.
- **Save your wallet backup** offline. It's the only way back in.
- **You always sign.** SlimeWire builds the trade; the transfer that moves your SOL is approved in **your own wallet**. Never share your seed phrase or recovery file with anyone.
- **Tools spend real SOL.** Bundle, Volume and Launch fire real trades and fees. Start small.

The loop: find a coin in **Trending** → check the security panel → **1-tap buy** → take profit in **Portfolio** → repeat. 🧟🔥
