

SlimeWire Master Guide

Every feature, how to use it, and how to maximize it — terminal, automation, Telegram bot, and the proof loops. June 2026.

Contents

- 1. The big picture — how everything connects
- 2. The terminal: feeds, quick buy, SlimeShield
- 3. Trading & server automation (TP/SL, Bundle, SlimeBot, Sniper)
- 4. Ogre A.I. & Autopilot
- 5. KOL Tracker & copy-trading
- 6. Pump Launch + Jito anti-snipe
- 7. Positions, PnL & share cards
- 8. Push alerts (phone notifications)
- 9. The Ogre Agent (site chat A.I.)
- 10. The Telegram bot — complete manual
- 11. The Proof Wall & growth loops
- 11b. Call Board, token rooms & signal cards (NEW)
- 12. Operator reference: switches, tuning, costs
- 13. Recommended next moves

1. The big picture

SlimeWire is three layers that feed each other:

- **The terminal** (slimewire.org) — live pairs, charts, one-tap trading, risk reads, and managed wallets that can run automation while your browser is closed.
- **The engine** (server) — TP/SL watchers, the scanner, SlimeShield scoring, Ogre A.I. autopilot, KOL copy plans, and the alpha-call tracker. It runs 24/7.
- **The megaphone** (Telegram bot + Proof Wall) — the engine's activity becomes public posts: plays every 15 minutes, win receipts, rug-flag receipts. Every post links back into the terminal with the buy panel ready.

The flywheel: **drops create attention** → **receipts create trust** → **deep links create users** → **users create more engine activity**.

2. The terminal: feeds, quick buy, SlimeShield

Feeds

- **Live Terminal / Cooks** — the main live feed. Rows refresh in place (your scroll position never jumps).
- **Live Pairs** — bucketed fresh pairs (live / under 1h / 3h / 1d) with best/newest sorting.

- **Slime Scope** — the scanner view with deeper per-row stats.
- **Watchlist** — tap *Watch* on any row to save a coin; *Saved* rows show a star.

Quick Buy

Set your amount once in the **Quick Buy SOL** box on any feed toolbar (or pick a preset). Every Buy button across the whole site instantly reads "**Buy 0.1 SOL**" with your live amount and fires with one tap. You can also just tell the chat agent: "*set quick buy to 0.5*".

SlimeShield

Every pair gets a verdict: **BUY / CAUTION / RISK / AVOID** with a 0–100 score, built from liquidity, age, volume flow, sell pressure, bundle risk, mint/freeze authority, dev-wallet history, and KOL dump pressure. The shield isn't advisory decoration — it actively gates Ogre A.I. buys and feeds the public receipts system.

Maximize it: keep a preset with your default TP/SL and size, then trade entirely from feed rows: see pair → one tap Buy → exits armed automatically. The terminal is built so you never need the trade desk for routine entries.

3. Trading & server automation

Wallets: two kinds, different powers

Wallet type	What it can do
Connected (Phantom / Solflare / Backpack)	Buy/sell with a wallet-approval popup each time. View-only positions tracking.
Managed (SlimeWire wallets)	Everything automated: server TP/SL, timers, Bundle, SlimeBot, Sniper, Ogre A.I., KOL copy — runs with your browser closed. Backup files download on creation; keep them.

Server TP/SL (the core safety net)

- Arm take-profit / stop-loss / timer exits on any buy. The server watches prices every ~2 seconds and executes without you.
- Requires the **TP/SL automation permission** (the "Enable TP/SL" button in the top bar). It expires periodically — the site now shows a **loud red warning** when armed plans are running on an expiring/expired permission. Re-enable immediately when you see it.
- Track every armed plan on the **TP/SL Audit** page (Tx Audit tab): status, per-wallet triggers, last price checks.

Bundle

One token bought/sold across many wallets at once, with auto-exit settings. Fast Bundle presets let you bundle-buy straight from a feed row (with an in-app confirm showing the wallet count).

SlimeBot (Volume)

The auto-volume engine: deploys a SOL budget over a duration as randomized buys/sells across recycled wallets (smart or spam mode, aggressiveness levels), then sweeps everything back to your source wallet. Confirm dialog shows the full deployment math before it spends.

OgreSniper & Launch Watch

Sniper scans seven modes (Safe / Smart / Fast / PumpSnipe / Low-MC / Narratives / Long) and one-tap snipes with your per-wallet amount and exits. Launch Watch arms a watcher for a ticker so the buy fires the moment it goes live.

4. Ogre A.I. & Autopilot

- **Manual runs:** pick a category, amount, and exits — Ogre A.I. scans, ranks, and apes the best pick into a managed plan with TP/SL armed.
- **Autopilot:** fully unattended. Hard guards you set: max SOL per buy, max spend per hour, max concurrent plans, minimum score, interval. Default OFF; you arm it.
- **The shield gate:** every Ogre A.I. buy runs a final SlimeShield check at purchase time. Only **AVOID** blocks — risky setups are allowed on purpose (they're often the biggest winners); your TP/SL plan is the risk control.
- It avoids repeating recent mints and diversifies across picks.

Maximize it: run autopilot small and steady (e.g. 0.05 SOL per buy, 0.3 SOL/hour cap, 2 concurrent) with a -8% stop. The math of many small shielded entries with hard stops is the win-rate play; the engine record on the Proof Wall will show it working.

5. KOL Tracker & copy-trading

- The KOL page tracks known trader wallets: live signals, positions, leaderboard.
- **Copy Wallet Next Buy:** pick a tracked wallet, set amount + exits — SlimeWire mirrors their next buy from your wallets within one ~30s scan tick and arms TP/SL on the copied bag automatically.
- **KOL Dump Detector** flags wallets that tend to sell into their followers — check it before copying anyone.

6. Pump Launch + Jito anti-snipe

- Create a pump.fun token from the Pump Launch page: coin details, image, socials, fees, dev buy, optional bundle buys.
- **Image pipeline is verified:** uploads go to pump.fun's own IPFS first, and the server confirms the image actually loads *before* the coin is created. Launching with no image now asks explicitly before using the default logo.
- **Jito anti-snipe is ON:** create + dev buy + first-block bundle buys land atomically in one Jito bundle — snipers physically cannot get between your create and your buys. Do your first launch with a small dev buy and watch it.
- Successful launches auto-post to your opted-in Telegram groups/channel with pump.fun + chart links — free promotion for every launch through your launcher.

7. Positions, PnL & share cards

- Each position row shows: live value, **entry cost**, **current MC**, open PnL, **TP/SL armed state** (or "no auto-exit armed"), and a green/red "▲ +0.012 SOL since last refresh" change note.

- **Arm Exits** button opens the trade ticket preloaded for that bag. Clicking the row opens its chart — everything stays inside SlimeWire.
- Sell 25/50/100% or custom % directly from the row (custom uses the in-app dialog).
- **PnL cards:** on the PnL page, *Card* downloads a branded PNG of the trade, *Post* shares it. In the Telegram DM, `/pn1 <token>` or `/card <token>` sends the same card.

8. Push alerts (phone notifications)

- **Enable:** Profile → Alerts → "Enable Push Alerts". Up to 5 devices per account.
- **iPhone:** first add SlimeWire to your Home Screen (Share → Add to Home Screen), open it from there, then enable.
- **You get pinged when:** a take-profit or stop-loss fires, a plan fails, or a KOL copy executes — with the site completely closed. Tapping the notification opens the TP/SL audit.

Maximize it: push alerts + server TP/SL = walk away from the screen. Arm the plan, close the laptop, get pinged when money moves. This is the feature that makes armed plans trustworthy.

9. The Ogre Agent (site chat A.I.)

The "Ask" bubble is a layered assistant — instant local smarts first, free 70B-class LLM (Groq Llama-3.3-70B, with Gemini/OpenRouter fallbacks) for everything else. It remembers the conversation.

Say things like	What happens
"where is the sniper" / "open my bags" / "take me to pnl"	Navigates instantly (no server round-trip), ~120 phrasings across all 21 pages
"set quick buy to 0.5"	Updates every Buy button on the site
paste any CA	Full coin read: MC, liquidity, volume, socials, SlimeShield verdict
"buy 0.1 of <CA> with 25 tp 8 sl"	Stages (or executes, in Fast Mode) the trade with exits
"how do push alerts work" / "how do I make a ref code"	Instant knowledge-card answers with action buttons
"why is this coin dumping" / anything open-ended	Goes to the LLM with your live site context (positions, shield, active token)

Fast Mode lets the agent execute trades from chat without an extra tap — you approve the auto-trade session first, and you can revoke any time.

10. The Telegram bot (@OgreTradeBot) — complete manual

In groups and channels

Command	What it does
<code>/look <CA></code>	Instant SlimeShield read: verdict icon, score, top risk factors, suggested action. Buttons:  Chart,  Buy on Site (buy panel opens automatically), Buy in DM, Dex,  Proof Wall. 20s per-chat cooldown.
<code>/alpha</code>	Top 3 scanner picks right now, each tap-to-chart with tap-to-copy CA. Falls through safe → fast → moonshot → live feed so it always returns picks.
<code>/ape</code>	One fresh low-MC shot right now (moonshot pool first). Honest verdict label + "size like it can go to zero."
<code>/receipts</code>	SlimeShield's rug-call record: hit rate + recent rugs with minutes-of-warning.
<code>/proof</code>	One quotable line of the live engine record (W-L, best call) + proof wall link.
<code>/slimewire on off</code>	(Admins) arms the live feed for that chat. Works for anonymous admins and in channels (post as admin). The ON confirmation gets pinned automatically when the bot has pin rights.

What an armed chat receives

- **Plays every 15 minutes:** 3–4 picks, each labeled ● BUY / ● CAUTION / ● RISK with its shield score (AVOID never posts), with the honest engine record in the footer ("Engine record: 12W-9L").
- **Win receipts:** when a dropped pick 2x's, the chat gets " ✔ Called it: \$XYZ is 2.4x since the drop 3h ago — First dropped in [your group]".
- **Engine events:** fresh SlimeWire launches, TP/SL fires ("stop-loss saved a bag"), KOL copy executions — all anonymous, never wallet info.
- **Hard anti-spam:** max 8 posts/hour per chat, minimum 2 minutes apart, dedupe — enforced in code, drops instead of queueing.

In DM

Full wallet ops: `/wallets`, `/balances`, `/trade` (guided buy/sell), `/positions`, `/pnl` + cards, `/sniper`, `/bundle`, backups/restore, and `/web` — which gives you a 6-digit code to log into slimewire.org with your Telegram-linked account.

The funnel mechanics

- Every bot keyboard's ⚡ **Buy on Site** opens the chart with the quick-buy panel already open — Telegram attention, site execution.
- **Buy in DM** deep-links into the bot's guided buy with the token preloaded — for users who haven't touched the site yet.
- Chart deep links paint an instant loading skeleton, so taps feel immediate.

11. The Proof Wall & growth loops

slimewire.org/proof — public, no login, loads instantly. Shows: calls tracked, 2x wins with time-to-win, hit rate, best call, rugs SlimeShield flagged first (with minutes-of-warning), live-tracking calls, and the **Group Alpha League** (top groups ranked by wins their drops produced — groups compete to host the bot).

Everything links here: drops, win receipts, `/proof`, `/receipts`, bot keyboards. The page is the answer to "is this legit" — and it includes the losses, which is exactly why it works.

Your playbook: (1) add the bot to every group you're in, get admins to `/slimewire on`; (2) screenshot win receipts to X with the `/proof` link; (3) launch coins through Pump Launch so every launch self-promotes; (4) share PnL cards after wins. Every piece feeds the same loop.

11b. Call Board, token rooms & signal cards (NEW)

The Call Board (every chart page)

Scroll below any chart and you get that token's room — but it is a **call board, not a chat**. Every post is structured:

- **Side:**  Bullish /  Bearish /  Warning /  Question
- **Optional target** (2x / 5x / 10x) and a 140-character "why"
- **Auto-stamped at post time:** SlimeShield verdict + score, entry market cap, entry price

Then SlimeWire **tracks the call automatically** on the same rules as its own drops: 2x = won, dead = lost, 48h = flat. Winners show "  hit 2.4x" on the post forever. One call per user per token per 6 hours — quality over noise. Reads are public; posting needs a login.

Caller reputation

Every handle carries its record (wins + hit-rate on resolved bullish calls) next to every post. Reputation is earned from outcomes, not volume — the top-caller aggregates are ready for a public leaderboard when there is a crowd to rank.

Signal cards (the clean shill engine)

The  **Signal Card** button on any call board renders a watermarked 1200×630 share image: \$SYMBOL, shield verdict + score, MC / liquidity / volume / 1h move, the CA, and the proof-wall link. Direct URL:

`/api/web/signal-card?tokenMint=<CA>` — drop it anywhere.

Live Ogre Brief (Ogre Tek hub)

A glanceable "right now" strip: fresh sub-8k pairs on the feed, how many plans are armed (and how many are near take-profit), and how many flagged tokens are being tracked to outcome.

Maximize it: post a call before you ape (free receipt if it runs), screenshot the signal card to X with your referral link, and check the Ogre Brief instead of doomscrolling feeds — it tells you when something needs your attention.

11c. The roadmap scorecard (external review items)

Idea	Status
Called-It receipts / proof tracking	LIVE — proof wall + drop receipts + call board
/ape command	LIVE
Group Alpha League	LIVE — proof wall + first-to-find credits
Token rooms / call board	LIVE

Caller reputation	LIVE (v1) — public leaderboard page pending
Signal/share cards	LIVE
TG deep links into site state	LIVE — buy panel opens from links
Live Ogre Brief	LIVE (v1) on the Tek hub
Main-nav consolidation (8 areas)	Deferred deliberately — a previous nav regroup was reverted; do this as a guided design pass, not a code drop
Daily degen missions	Not built — needs a rewards engine; badges exist to hook into
KOL report cards	Not built — dump-detector data exists
Launch campaign mode	Partial — launches auto-post; countdown/sponsor slots pending
Freeform global chat	Skipped on purpose — matches the advice; call boards first

12. Operator reference

Switches currently ON

Thing	State
Jito anti-snipe launches (<code>PUMP_LAUNCH_JITO_BUNDLE</code>)	ON
Push alert keys (VAPID)	ON
Alpha drops + winner receipts	ON (per chat via <code>/slimewire on</code>)
Shield receipts tracking	ON (always recording)
Channel bridge flag (<code>TG_CHANNEL_ALERTS_ENABLED</code>)	ON — but needs <code>TG_CHANNEL_CHAT_ID=@yourchannel</code> to use the dedicated 6/hour channel feed; otherwise just <code>/slimewire on</code> in the channel
Ogre Agent models	Groq Llama-3.3-70B primary, OpenRouter 70B free fallback

Tuning knobs (Render → Environment)

Env var	Default	Controls
<code>TG_ALPHA_DROP_INTERVAL_MINUTES</code>	15	How often plays post per chat
<code>TG_ALPHA_DROP_PICKS</code>	4	Picks per drop (1–4)
<code>TG_CHANNEL_MAX_PER_HOUR</code>	6	Dedicated channel post cap
<code>KOL_COPY_SCAN_INTERVAL_MS</code>	30000	Copy-trade reaction speed

Costs & housekeeping

- **Render build minutes:** every git push builds 3 services. Set **Auto-Deploy: No** on the two background workers (they only call the web service over HTTP) to cut the burn by two-thirds. Top up minutes before big shipping days.
- **All A.I. is free-tier** (Groq/Gemini/OpenRouter). If the agent ever degrades, check those keys' quotas first.
- **Backups:** managed-wallet backup files download on creation and removal — store them; they're the only restore path.

13. Recommended next moves

- **Set the channel chat ID** (or just `/slimewire on` in the channel) and pin the proof wall there. *5 minutes.*
- **Test a Jito launch** with a small dev buy — the anti-snipe bundle is armed but hasn't fired on a real launch yet. *15 minutes.*

- **Signal share cards** (proposed, not built): server-rendered token cards (MC, age, verdict, chart QR) shared from any row — the X skill engine. The PnL card renderer is ready to copy. *Best next build.*
- **KOL report cards** (proposed, not built): shareable "this KOL sells into followers" cards from the dump detector — sticky, viral, drama-powered.
- **Landing-page engine ticker** (proposed, not built): the live proof strip on the front door before login.
- **Launch campaign mode** (partial): launches already auto-post; the countdown + sponsor-slot layer is worth building once launch volume picks up.
- **Referral wars** (partial): trader board + badges exist; rank by invites/volume/wins when there's a user base to rank.
- **Watch your TP/SL permission** — when the red expiry warning appears, re-enable. It's the one thing automation can't do for you.
